INTRODUCTION Coxeter Groups Automata: What and Why

THE BRINK-HOWLETT AUTOMATON A_{BH} Geometric Representation of Coxeter Groups The Root System

MINIMALITY OF A_{BH} Main Result Outline of Proof

COXETER SYSTEMS

► Recall: A Coxeter System is a pair (W, S) consisting of a group W and a set of generators S ⊂ W subject only to relations of the form

$$(st)^{m(s,t)} = 1$$

where m(s,s) = 1 and $m(t,s) = m(s,t) \ge 2$ for $s \ne t$. ($m(s,t) = \infty$ is allowed).

EXAMPLES

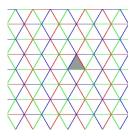

Symmetry groups of regular polytopes

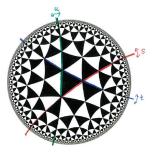

EXAMPLES

- Symmetry groups of regular polytopes
- Weyl groups of simple Lie algebras

EXAMPLES

- Symmetry groups of regular polytopes
- Weyl groups of simple Lie algebras
- Triangle groups corresponding to tessellations of the Euclidean/Hyperbolic plane.

The word *stsutu* is not reduced.

Since sts = tst and utu = tut. We have

$$stsutu = tsttut = tsut$$

AUTOMATA FOR GROUPS

Motivation:

► Let *G* be a group with generating set *S*.

AUTOMATA FOR GROUPS

Motivation:

- ► Let *G* be a group with generating set *S*.
- The word problem: Given a word $w = s_1 s_2 \cdots s_k$ with $s_i \in S$, does it represent the identity?

AUTOMATA FOR GROUPS

Motivation:

- ► Let *G* be a group with generating set *S*.
- The word problem: Given a word $w = s_1 s_2 \cdots s_k$ with $s_i \in S$, does it represent the identity?
- Given a string of generators, is it a reduced expression?

AUTOMATA FOR GROUPS

Definition

Let W be a group with generating set S. A **Finite State Automaton** for (W, S) is a finite directed graph capable of reading words $w \in W$ and giving the answer YES if and only if the word w is reduced.

AUTOMATA FOR GROUPS

Definition

Let W be a group with generating set S. A **Finite State Automaton** for (W, S) is a finite directed graph capable of reading words $w \in W$ and giving the answer YES if and only if the word w is reduced.

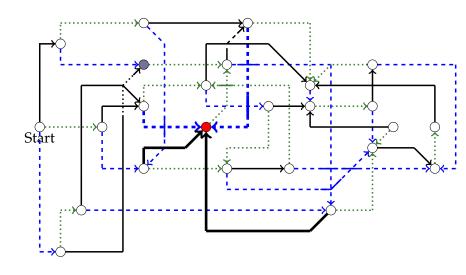

$$\langle s, t \mid s^2 = t^2 = 1 \rangle$$

FINITE STATE AUTOMATA FOR COXETER GROUPS

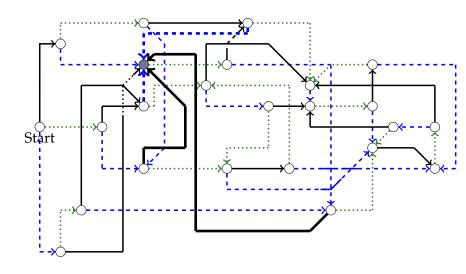

Theorem (Brink-Howlett, 1993)

For each finitely generated Coxeter group W, there exists a finite state automaton which recognises the language of reduced words of W.

For which Coxeter systems is the Brink-Howlett automaton minimal?

GEOMETRIC REPRESENTATION OF COXETER GROUPS

• Step 1: Build a vector space $V = \bigoplus_{s \in S} \mathbb{R}\alpha_s$

- **Step 1:** Build a vector space $V = \bigoplus_{s \in S} \mathbb{R}\alpha_s$
- Step 2: Define angles via a symmetric bilinear form:

$$\langle \alpha_s, \alpha_t \rangle = -\cos \frac{\pi}{m(s,t)}$$

(If *W* is finite, this is usual inner product)

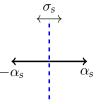

- **Step 1:** Build a vector space $V = \bigoplus_{s \in S} \mathbb{R}\alpha_s$
- Step 2: Define angles via a symmetric bilinear form:

$$\langle \alpha_s, \alpha_t \rangle = -\cos \frac{\pi}{m(s,t)}$$

(If *W* is finite, this is usual inner product)

Step 3: For each $s \in S$, define $\sigma_s \in GL(V)$ by

$$\sigma_s(v) = v - 2\langle \alpha_s, v \rangle \alpha_s$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

- Step 1: Build a vector space $V = \bigoplus_{s \in S} \mathbb{R}\alpha_s$
- Step 2: Define angles via a symmetric bilinear form:

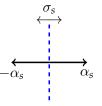

$$\langle \alpha_s, \alpha_t \rangle = -\cos \frac{\pi}{m(s,t)}$$

(If *W* is finite, this is usual inner product)

► Step 3: For each $s \in S$, define $\sigma_s \in GL(V)$ by

$$\sigma_s(v) = v - 2\langle \alpha_s, v \rangle \alpha_s$$

• **Remark:** This is a faithful representation.

Compact hyperbolic graphs with no curcuits or infinite bonds

• • • • • • where
$$a, b < \infty, \frac{1}{a} + \frac{1}{b} < \frac{1}{2}$$
.

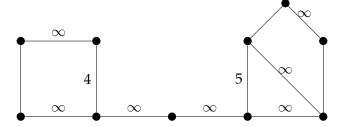

Theorem (J. Parkinson, Y.Y, 2018)

Let (*W*, *S*) *be a finitely generated Coxeter system. The following are equivalent:*

- (1) The Brink-Howlett automaton A_{BH} is minimal.
- (2) The Coxeter graph of (W, S) does not have a subgraph contained in \mathscr{X} .
- (3) The set of elementary roots is $\mathscr{E} = \Phi_{\text{sph}}^+$.

The automaton A_{BH} is minimal for this Coxeter group!

MINIMAL AUTOMATON

For $w \in W$ define the *cone type* of w:

$$T(w) = \{ v \in W \mid \ell(wv) = \ell(w) + \ell(v) \}.$$

MINIMAL AUTOMATON

For $w \in W$ define the *cone type* of w:

$$T(w) = \{v \in W \mid \ell(wv) = \ell(w) + \ell(v)\}.$$

 In the unique minimal automaton recognising the language of reduced words each state must be equivalent to a single cone type.

▲ロト ▲ 理 ト ▲ 王 ト ▲ 王 - の Q (~

MINIMAL AUTOMATON

• For $w \in W$ define the *cone type* of w:

$$T(w) = \{v \in W \mid \ell(wv) = \ell(w) + \ell(v)\}.$$

- In the unique minimal automaton recognising the language of reduced words each state must be equivalent to a single cone type.
- ► The automaton A_{BH} is minimal if and only if T(w) = T(v) whenever $\mathscr{E}(w) = \mathscr{E}(v)$.

OUTLINE OF PROOF

(1) \implies (2): If \mathcal{A}_{BH} is minimal for W then Γ_W does not have a subgraph in \mathscr{X} .

OUTLINE OF PROOF

(1) \implies (2): If \mathcal{A}_{BH} is minimal for W then Γ_W does not have a subgraph in \mathscr{X} .

Lemma

Let (W, S) *be a finitely generated Coxeter system. If there exists* $J \subset S$ *and* $t \in S$ *such that:*

- (i) J is spherical, and
- (ii) $J \cup \{t\}$ is not spherical, and
- (iii) $w_J(\alpha_t) \in \mathscr{E}$, where w_J is the unique longest element of W_J .

Then $T(t \cdot w_J) = T(w_J)$ and $\mathscr{E}(w_J) \neq \mathscr{E}(t \cdot w_J)$.

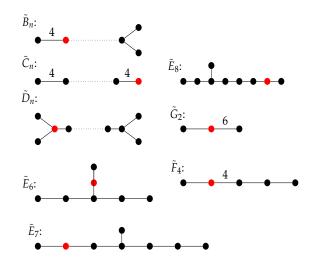

Examining the diagrams Γ in \mathscr{X} , applying the lemma, we find our desired $J \subset S$ and $t \in S$.

- Examining the diagrams Γ in \mathscr{X} , applying the lemma, we find our desired $J \subset S$ and $t \in S$.
- In the case of affine graphs, we make a special choice based on the root system Φ₀ of the associated finite Weyl group.

- Examining the diagrams Γ in \mathscr{X} , applying the lemma, we find our desired $J \subset S$ and $t \in S$.
- In the case of affine graphs, we make a special choice based on the root system Φ₀ of the associated finite Weyl group.
- Fact: Let φ be the highest root of Φ_0 . There is a unique simple root α_t , such that $\langle \varphi, \alpha_t \rangle = 1$ and $\langle \varphi, \alpha_i \rangle = 0$ for all other simple roots α_i .

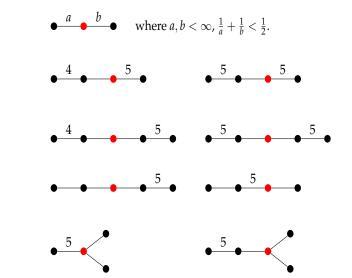

▲ロト ▲ 理 ト ▲ 王 ト ▲ 王 - の Q (~
